APPROACHING 20?? YEAR?^{**}

The whole life is constantly challenging, we are living in an extremely changing environment. This effects fear, additionally the devastation of our globe.

To know what in 2050 is going to happen it's a part of prophecy. In reality our future is always our destiny which is uncertain and has so many factors which can't be considered. There is no linear elapsing development. The most challenging what we have are the explosion of the population, an enormous erosion of our planet by pollution of the air, the land and the water. Especially I am thinking on the enormous effect on CO₂ by our human activities, the erosion of the land by deforestation and spoiling the water. Especially the seas are full of litter, the seas are not a litter box of our world. We need the deep personal impact and contribution of all people in a critical evaluation and survey of our doing.

The key issue is developing and to contribute in a comprehensive look where everybody can understand the fears of the others and in order to cultivate our planet. The nature is very patient — but how long. But over time nature can't tolerate and compensate all the negative effects of our human doings. The future of mankind is endangered by devastating our nature in any sense. But it is very difficult to bring a change of the human doing. We all have to motivate all on different levels.
