# Schwarz lemma and optimal recovery of functions in H<sup>2</sup>

Key words: extremal problems, optimal recovery, Hardy spaces, Shwartz lemma

Let  $D \subset C^k$  be a domain,  $\nu$  be a probability measure on  $\overline{D}$  and X be a closed subspace of  $L^2(\nu)$ . Consider  $D_0, \ldots, D_n \subset D$  and probability measures  $\mu_0, \ldots, \mu_n$  on  $D_0, \ldots, D_n$  respectively. We suppose that  $X \subset L^2(\mu_j), j = 0, 1, \ldots, n$ . We allow one of  $D_j$  to coincide with D. In this case we assume that  $\mu_j$  coincides with  $\nu$ .

Write  $\mathcal{D} = (D_0, \dots, D_n), \mu = (\mu_0, \dots, \mu_n), \mu = (\mu_1, \dots, \mu_n), y = (y_1, \dots, y_n).$ 

# 1. Optimal recovery problem

Given  $y_1, \ldots, y_n$  defined on  $D_1, \ldots, D_n$  such that

$$||f_j - y_j||_{L^2(\mu j)} \le \delta_j, j = 1, \dots, n,$$

we are to reconstruct f. Here  $f_j$  is the restriction of f to  $D_j$  and  $delta_j \geq 0, j = 1, \ldots, n$  are accuracy levels. In particular,  $delta_j = 0$  means that f is known precisely on  $D_j$ 

A recovery algorithm (method, procedure, etc.) is an operator

$$A: L^2(\mu_1) \times \cdots \times L^2(\mu_n) \mapsto L^2(\mu_0).$$

We consider  $A(y), y = (y_1, \ldots, y_n)$ , to be the recovered value of f on  $D_0$ . At this point we impose no conditions on A.

The maximal possible error of a method A is

$$e(X, \mathcal{D}, \mu, \delta, A) = \sup\{\|f_0 - A(y)\|_{L^2(\mu_0)} : f \in X, y \in L^2(\mu_1) \times \dots \times L^2(\mu_n), \|f_j - y_j\|_{L^2(\mu_j)} \le \delta_j, j = 1, \dots, n\}$$

The optimal recovery error as

$$E(X, \mathcal{D}, \mu, \delta) = \inf_{A: L^2(\mu_1) \times \dots \times L^2(\mu_n) \mapsto L^2(\mu_0)} e(X, \mathcal{D}, \mu, \delta, A).$$

A method  $\widehat{A}$  such that

$$E(X, \mathcal{D}, \mu, \delta) = e(X, \mathcal{D}, \mu, \delta, \widehat{A})$$

is called an optimal recovery method.

The problem of finding an optimal recovery method (and sometimes an extremal function at which the optimal recovery error is attained) is usually referred to as *optimal recovery problem*.

### 2. Extremal problem

The optimal recovery problem is closely related to the following extremal problem. Find

$$||f_0||_{L^2(\mu^0)} \mapsto \sup_{j} f \in X, ||f_j||_{L^2(\mu_j)}^2 \le \delta_j^2, j = 1, \dots n.$$
 (1)

A special case of this extremal problem is when D is the unit disk  $\mathbb{D}$ ,  $\mu_0$  and  $\mu_1$  are point masses and  $\mu_2$  is the normalized Lebesgue measure on the unit circle. Here the problem turns into

$$\max\{|f(a_0)|:|f(a_1)|\leq \delta_1, \|f\|_{H^2}\leq \delta_2\},\$$

which might be viewed as a version of the classical Schwarz lemma. Here we consider another variant of Scwarz Lemma. Let  $a \in \mathbb{D}$  and  $\Gamma$  be a circle inside of the unit disk,  $\mu$  be the normalized Lebesgue measure on  $\Gamma$ , and  $\mu > 0$ . Find

$$\sup \left\{ \int_{\Gamma} |f|^2 d\mu : f \in H^2, \ ||f||_{H^2}^2 \le 1, \ |f(a)| \le \delta \right\}. \tag{2}$$

We will consider the case when the circle  $\Gamma$  passes through the origin and its center lies on the real axis, so that

$$\Gamma = \{z \in \mathbb{C} : |z - \rho| = \rho\}, \ 0 < \rho < 1/2.$$

The corresponding optimal recovery problem is: Reconstruct a Hardy function f from its values on the circle  $\Gamma$  and at a given with some tolerance.

### 3. Euler equation for the general problem

Let K(z, w) be the reproducing kernel of X. Write

$$\tilde{\mu} = -\mu_0 + \sum_{j=1}^n \lambda_j \mu_j.$$

Then  $\tilde{\mu}$  is a regular measure on D and every function from X is square- integrable with respect to  $\tilde{\mu}$ . For  $w \in D$  we introduce

$$d\tilde{\mu}_w(z) = K(z, w)d\tilde{\mu}(z).$$

Obviously every function from X is  $\tilde{\mu}_w$ -integrable.

We further define

$$\tau_w^{\lambda}(z) = \int_D K(z\tau) d\tilde{\mu}_w(\tau).$$

**Theorem 1.** If  $\widehat{f} \in X$  is a solution of the general extremal problem above, then there exists a non-negative vector  $\widehat{\lambda} = (\widehat{\lambda}_1, \dots, \widehat{\lambda}_n)$  such that

$$\widehat{f} = (span\{\tau_w^{\widehat{\lambda}}, w \in D\})^{\perp},$$

and

$$\widehat{\lambda}_j(\|f\|_{L_2(\mu_j)} - \delta_j) = 0, \ j = 1, \dots, n.$$

We say that a non-negative vector  $\lambda = (\lambda_1, \dots, \lambda_n)$  belongs to the spectrum of the problem, if there exists an admissible for this problem function  $f \in X$  such that

1. 
$$\lambda_j(\|f\|_{L^2(\mu_j)} - \mu_j) = 0.$$
  
2.  $f \in (spann\{\tau_w^\lambda : w \in D\})^\perp.$ 

In this case we call f a spectral function.

**Theorem 2.** Let  $\Lambda$  be the spectrum of the problem. Then

$$\sup_{\|f\|_{L_2(\mu_j)} \le \delta_j, j=1,\dots,n} = \sup_{\lambda \in \Lambda} \sum_{j=1}^n \lambda_j \delta_j^2.$$
 (3)

We call a spectral point  $(\widehat{\lambda}_1, \dots, \widehat{\lambda}_n)$  extremal, if the maximum of the right-hand side of (3) is attained at  $(\widehat{\lambda}_1, \dots, \widehat{\lambda}_n)$ .

# 4. Spectrum of the Schwarz Lemma

Here we have:

$$\begin{split} \tau_w^\lambda &= -\frac{1}{\pi} \int_{\Gamma} \frac{1}{1-z\overline{\tau}} \cdot \frac{1}{1-\tau\overline{w}} \cdot \frac{|d\tau|}{|\tau-\rho|} + \\ \lambda_1 \frac{1}{1-z\overline{a}} \cdot \frac{1}{1-a\overline{w}} + \frac{\lambda_2}{2\pi} \int_{|\tau|=1} \frac{1}{1-z\overline{\tau}} \cdot \frac{1}{1-\tau\overline{w}} |d\tau| &= \\ -\frac{1}{1-z\rho-\rho\overline{w}} + \frac{\lambda_1}{(1-z\overline{a})(1-a\overline{w})} + \frac{\lambda_2}{1-z\overline{w}}. \end{split}$$

By Theorem 1 every extremal function satisfies the following equation

$$\frac{1}{1 - \rho w} f\left(\frac{= \rho}{1 - \rho w}\right) = \lambda_1 \frac{f(a)}{1 - \overline{a}w}$$

for some  $\lambda_1, \lambda_2 \geq 0$  and all  $w \in \mathbb{D}$ . Let

$$b = \frac{1 - \sqrt{1 - 4\rho^2}}{2\rho}.$$

Then b is the Denjoy-Wolff point of the following self-mapping of  $\mathbb{D}$ 

$$z \mapsto \frac{\rho}{1 - \rho z},$$

and the disk bounded by the circle  $\Gamma$  is a hyperbolic neighborhood of b. Consider the following functions

$$\varphi_j(z) = \frac{\sqrt{1-b^2}}{1-bz} \left(\frac{b-z}{1-bz}\right)^j, j = 0, 1, \dots$$

These functions form an orthonormal basis of  $H^2$ , and they are eigenfunctions of the operator

$$Tf(z) = \frac{1}{1 - \rho z} f\left(\frac{\rho}{1 - \rho z}\right),$$

and the corresponding eigenvalues are

$$\alpha_j = \frac{b^{2j}}{1 - \rho b}.\tag{4}$$

Theorem 3. Let  $a \neq b$ .

1. *If* 

$$\left| a - \frac{\rho}{1 - \rho^2} \right| \ge \frac{\rho^2}{1 - \rho^2},$$

or

$$\delta > \frac{\sqrt{|a|^2 \rho^2 - |\rho - a|^2}}{a\rho + \overline{a}\rho - |a|^2},$$

then the spectrum of Schwarz Lemma extremal problem consists of two parts  $\Lambda = \Lambda_1 \cup \Lambda_2$ , where

$$\Lambda_1 = \{ (0, \alpha_j) : |\varphi_j(a)| \le \delta \},$$
  

$$\Lambda_2 = f(\lambda_1, \lambda_2) : \lambda_1, \lambda_2 > 0,$$
  

$$F(\lambda_2) = \delta^{-2}, \lambda_1 = h(\lambda_2)$$

where

$$F(\lambda) = \sum_{j=0}^{\infty} \frac{|\varphi_j(a)|^2}{(a_j - \lambda)^2} h^2(\lambda),$$

$$h(\lambda) = \left(\sum_{j=0}^{\infty} \frac{|\varphi_j(a)|^2}{a_j - \lambda}\right)^{-1}.$$

2. *If* 

$$\left| a - \frac{\rho}{1 - \rho^2} \right| < \frac{\rho^2}{1 - \rho^2},$$

and

$$\delta \leq \frac{\sqrt{|a|^2\rho^2 - |\rho - a|^2}}{a\rho + \overline{a}\rho - |a|^2},$$

then the spectrum includes in addition the point

$$\Lambda_3 = \left\{ \left( \frac{a\rho + \overline{a}\rho - |a|^2}{\rho^2}, 0 \right) \right\}.$$

Theorem 4. Let a = b,

$$\Lambda_1 = \{ (0, \alpha_j) : j = 1, 2, \dots, \},$$

$$\Lambda_2 = \{ ((1 - b^2)(\alpha_0 - \alpha_i), \alpha_i) : j = 1, 2, \dots, \}.$$

Then the spectrum of problem is  $\Lambda = \Lambda_1 \cup \Lambda_2$ , if  $\delta < \frac{1}{\sqrt{1-b^2}}$ , and  $\Lambda = \Lambda_1 \cup \Lambda_2 \cup \{(0, \alpha_0)\}$ , if  $\delta \geq \frac{1}{\sqrt{1-b^2}}$ .

It turns out that  $\Lambda_2$  is the most important part of the spectrum.

**Proposition 1.** If a lies outside  $\Gamma$ , then  $F(\lambda) \to \infty$  as  $\lambda \to 0$ .

This Proposition implies that if a lies outside  $\Gamma$ , then  $\Lambda_2$  contains only finite number of points.

Now we will use Theorem 2 to describe the extremal points of the spectrum.

**Proposition 2.** If  $\delta \geq |\varphi_0(a)|$ , then  $(0, \alpha_0)$  is the extremal point of the spectrum.

**Proposition 3.** If a = b and  $\delta < 1/\sqrt{1-b^2}$ , then the extremal spectral point is

 $(\widehat{\lambda}_1, \widehat{\lambda}_2) = ((1 - b^2)(\alpha_0 - \alpha_1), \alpha_1).$ 

**Proposition 4.** If  $\delta < |\varphi_0(a)|$ , then  $\Lambda_1$  does not contain extremal spectral points.

Note that the function

$$g(\lambda) = \sum_{j=0}^{\infty} \frac{|\varphi_j(a)|^2}{\alpha_j - \lambda} \tag{7}$$

is monotone and increases from  $-\infty$  to  $+\infty$  when  $\lambda \in (\alpha_{j+1}, \alpha_j)$ . Let  $\zeta_j$  be the only zero of g on the interval  $(\alpha_{j+1}, \alpha_j)$ .

**Proposition 5.** Let  $a \neq b$ . If  $\delta \leq |\varphi_1(a)|$ , then the extremal spectral point  $(\widehat{\lambda}_1, \widehat{\lambda}_2)$  is unique, belongs to  $\Lambda_2$  and is determined by the condition  $\zeta_0 < \widehat{\lambda}_2 < \alpha_0$ .

**Proposition 6.** Assume that  $|\varphi_1(a)| < \delta < |\varphi_0(a)|$  and

$$\gamma = \left| \frac{b - a}{1 - ab} \right| \ge b^{2/3},$$

then the conclusion of Proposition 5 is valid, that is, the extremal spectral point  $(\widehat{\lambda}_1, \widehat{\lambda}_2)$  is unique, belongs to  $\Lambda_2$  and is determined by the condition that  $\zeta_0 < \widehat{\lambda}_2 < \alpha_0$ .

# 5. Optimal Recovery Method

The following result is due to Magaril-Il'yaev and Osipenko.

**Theorem 5.** Assume that there exist  $\widehat{\lambda}_j \geq 0$ , j = 1, ..., n, such that the value of the extremal problem

$$||f_0||_{L_2(\mu_0)}^2 \mapsto \max,$$

$$\sum_{j=1}^{\infty} \widehat{\lambda}_j \|f_j\|_{L_2(0,\mu_j)}^2 \le \sum_{j=1}^{\infty} \widehat{\lambda}_j \delta_j^2, \ f \in X$$

is the same as in (1). Moreover, assume that for every  $\tilde{y} = (\tilde{y}_1, \ldots, \tilde{y}_n) \in Y_1 \times \cdots \times Y_n$ , where  $Y_j$  are almost everywhere dense in  $L^2(\mu_j)$ , there exists  $f_{\tilde{y}}$  which is a solution of the extremal problem

$$\sum_{j=1}^{\infty} \widehat{\lambda}_j \|f_j - \tilde{y}_j\|_{L_2(0,\mu_j)}^2 \to \min, \ f \in X.$$
 (8)

Moreover, let  $\widehat{A}: L^2(\mu 1) \times \cdots \times L^2(\mu_n) \mapsto L^2(\mu_0)$  be a linear continuous operator, where the norm in  $L^2(\mu 1) \times \cdots \times L^2(\mu_n)$  is defined as

$$||y|| = \left(\sum_{j=1}^{n} ||y_j||_{L^2(\mu_j)}\right)^{1/2},$$

such that for all  $\tilde{y} = (\tilde{y}_1, \dots, \tilde{y}_n) \in Y_1 \times \dots \times Y_n$ ,

$$\widehat{A}(\widetilde{y}) = (f_{\widetilde{y}})_0.$$

Then

$$E(X, \mathcal{D}, \mu, \delta) = \sup_{\substack{f \in X \\ \|f_j\|_{L_2(\mu_j)} \le \delta_j, j = 1, \dots, n}} \|f_0\|_{L^2(\mu_0)}$$

and the method  $\widehat{A}(y)$  is optimal.

We will apply Theorem 5 to the construction of optimal recovery method for the Schwarz Lemma type problem considered above.

Consider the extremal problem

$$\int_{\Gamma} |f|^2 d\mu \to \sup,\tag{9}$$

$$f \in H^2$$
,  $\widehat{\lambda}_1 |f(a)|^2 + \widehat{\lambda}_2 ||f||_{H^2}^2 \le \widehat{\lambda}_1 \delta^2 + \widehat{\lambda}_2$ 

where as before  $\mu$  is the normalized Lebesgue measure on  $(\widehat{\lambda}_1, \lambda_2)$  is an extremal spectral point for problem (2).

Proposition 7. Suppose that either

- 1.  $a \neq b$  and  $\delta \leq |\varphi_1(a)|$ , or  $|\varphi_1(a)| < \delta < |\varphi_0(a)|$  and  $\gamma = \left|\frac{b-a}{1-ab}\right| \geq b^{2/3}$ , or
- 2.  $a = b \text{ and } \delta < \varphi(b) = 1/\sqrt{1 b^2}$ .

Then the values of extremal problems (2) and (9) are the same.

**Theorem 6.** Suppose that one of the following conditions is satisfied

- 1.  $\delta \geq |\varphi_0(a)|$ ,
- 2.  $\delta \leq |\varphi_1(a)|$ ,
- 3.  $|\varphi_1(a)| < \delta < |\varphi_0(a)|, \ \gamma \ge b^{2/3},$
- 4. a = b,

and  $(\widehat{\lambda}_1, \widehat{\lambda}_2)$  the corresponding extremal spectral point. Then the error of optimal recovery is given by

$$\sqrt{\widehat{\lambda}_1 \delta^2 + \widehat{\lambda}_2}$$

and the method

$$\widehat{A}(y)(z) = \frac{\widehat{\lambda}_1 y}{\widehat{\lambda}_1 + \widehat{\lambda}_2 (1 - |a|^2)} \cdot \frac{1 - |a|^2}{1 - \overline{a}z}$$
(10)

is optimal.

Note that for a=b the optimal method of recovery (10) does not depend on  $\delta$  and has the form

$$\widehat{A}(y)(z) = \frac{1 - |b|^2}{1 - bz}.$$

# 6. Open problems

1. It would be desirable to identify the extremal spectral point in all possible cases. We have shown that in a number of cases the extremal spectral point is the only point in  $\Lambda_2$  such that  $\zeta_0 < \widehat{\lambda}_2 < \alpha_0$ . Our attempts to find a nontrivial-case when this point is not extremal failed. Thus, we are tempted to conjecture that the point of  $\Lambda_2$  with the biggest  $\lambda_2$  is always extremal.

Conjecture. If  $a \neq b$  and  $\delta < |\varphi_0(a)|$ , the point in  $\Lambda_2$  such that  $\zeta_0 < \widehat{\lambda}_2 < \alpha_0$ . is always the spectral extremal point for problem (2).

2. It is natural to ask which choice of a minimizes the value of problem (2) (of course, this choice of a leads to the least optimal recovery error). It follows from above discussion that the point b plays a special role.

**Problem.** Does the choice a = b always lead to the least mean square optimal recovery error?

3. Finally, if in problem (2) we replace the constraint  $|\varphi(a)| \leq \delta$  with

$$\frac{1}{2\pi i} \int_{|z-a|=r} |f(z)|^2 d(z-a) \le \delta, \ 0 < r < 1 - |a|,$$

then the problem becomes even more difficult. The reason is that in the right hand side of Euler's equation the term  $\lambda_1 \frac{f(a)}{1-\overline{a}z}$  is replaced with

$$\lambda_1 f\left(a - \frac{r^2 z}{1 - \overline{a}z}\right).$$

and the equation turns into

$$\frac{1}{1 - \rho w} f\left(\frac{\rho}{1 - \rho w}\right) = \frac{\lambda_1}{1 - \overline{a}z} f\left(a - \frac{r^2 z}{1 - \overline{a}z}\right) + \lambda_2 f(w)$$

Thus, finding the spectrum in this case is reduced to finding eigenvalues of an operator which is a linear combination of two compact non-commuting operators. It would be very interesting to find the eigenbasis which corresponds to this problem and to find the solution.
