## SCIENCE IS BEYOND AND ABOVE POLITICS

**Abstract:** A very important relation between science and politics from the stand of the development of a society is – through history. If they are too close – the science may burnout. In opposite case, if too distant from each other, science may remain undeveloped. In the society where science has always found itself on margins it was slowed down its pace through history of science. The right position of science in the society has been exceptional platform for its comprehensive development. Following such status of science and politics one had to evaluate also the basic principles on which the two important components of every society lay upon. There are plenty examples for the above stated in the overall, but also within the regional – homeland historical past. That bond between the past and the future in theoretic sense could be perceived also as a future past and the past future; it is much more important in science. The science in general rejects the suggestion – recommendation of policy to forget the past in the name of the future.

Serious programming of the future has to lean on the good knowing of the past. Everyone can be misunderstood once. And that's one more proof that every prediction of the future implies rich experience from the past.

We are considering the given topic of mutual relation of science and politics starting from this historical aspect – using the examples from local, even from recent or contemporary history. The wrestling of science and politics lasts for ages. Perhaps in our time is the most intense. In the future struggle of science and politics – there is no dilemma such as: science or politics, despite the fear from politics. Politics is daily based, but science is of much longer run. It carries along and brings the future both to society and state.
